

# Contents

Foreword — V

Lessons — XI

Literature Basis — XIII

## **1 Introduction to polymer physical chemistry — 1**

- 1.1 Targets of this book — 1
- 1.2 Definition of terms — 2
- 1.3 Irregularity of polymers — 5
  - 1.3.1 Nonuniformity of monomer connection in a chain — 5
  - 1.3.2 Polydispersity in an ensemble of chains — 6
    - 1.3.2.1 Derivation of the Schulz–Flory distribution — 11
    - 1.3.2.2 Derivation of the Schulz–Zimm distribution — 13
    - 1.3.2.3 Characteristic averages of the Schulz–Flory and Schulz–Zimm distribution — 14
- 1.4 Properties of polymers in contrast to low molar mass materials — 16
- 1.5 Polymers as soft matter — 18
- 1.6 History of polymer science — 20

## **2 Ideal polymer chains — 25**

- 2.1 Coil conformation — 26
  - 2.1.1 Micro- and macroconformations of a polymer chain — 26
  - 2.1.2 Measures of size of a polymer coil — 29
- 2.2 Simple chain models — 31
  - 2.2.1 The random chain (phantom chain, freely jointed chain) — 31
  - 2.2.2 The freely rotating chain — 33
  - 2.2.3 The chain with hindered rotation — 33
  - 2.2.4 The Kuhn model — 34
  - 2.2.5 The rotational isomeric states model — 36
  - 2.2.6 Energetic versus entropic influence on the shape of a polymer — 38
  - 2.2.7 The persistence length — 39
  - 2.2.8 Summary — 40
- 2.3 The Gaussian coil — 42
- 2.4 The distribution of end-to-end distances — 43
  - 2.4.1 Random-walk statistics — 43
- 2.5 The free energy of ideal chains — 49
- 2.6 Deformation of ideal chains — 49

|          |                                                                                                                                |            |
|----------|--------------------------------------------------------------------------------------------------------------------------------|------------|
| 2.6.1    | Entropy elasticity —                                                                                                           | 49         |
| 2.6.2    | A scaling argument for the deformation of ideal chains —                                                                       | 53         |
| 2.7      | Self-similarity and fractal nature of polymers —                                                                               | 55         |
| <b>3</b> | <b>Real polymer chains —</b>                                                                                                   | <b>59</b>  |
| 3.1      | Interaction potentials and excluded volume —                                                                                   | 60         |
| 3.2      | Classification of solvents —                                                                                                   | 64         |
| 3.3      | Omnipresence of the $\Theta$ -state in polymer melts —                                                                         | 66         |
| 3.4      | The conformation of real chains —                                                                                              | 68         |
| 3.4.1    | Coil expansion —                                                                                                               | 68         |
| 3.4.2    | Flory theory of a polymer in a good solvent —                                                                                  | 70         |
| 3.5      | Deformation of real chains —                                                                                                   | 74         |
| 3.6      | Chain dynamics —                                                                                                               | 78         |
| 3.6.1    | Brownian motion and diffusion —                                                                                                | 78         |
| 3.6.2    | The Rouse model —                                                                                                              | 80         |
| 3.6.3    | The Zimm model —                                                                                                               | 82         |
| 3.6.4    | Relaxation modes —                                                                                                             | 84         |
| 3.6.5    | Subdiffusion —                                                                                                                 | 86         |
| 3.6.6    | Validity of the models —                                                                                                       | 87         |
| <b>4</b> | <b>Polymer thermodynamics —</b>                                                                                                | <b>89</b>  |
| 4.1      | The Flory–Huggins mean-field theory —                                                                                          | 89         |
| 4.1.1    | The entropy of mixing —                                                                                                        | 93         |
| 4.1.2    | The enthalpy of mixing —                                                                                                       | 96         |
| 4.1.3    | The Flory–Huggins parameter as a function —                                                                                    | 99         |
| 4.1.4    | Microscopic demixing —                                                                                                         | 102        |
| 4.1.5    | Solubility parameters —                                                                                                        | 103        |
| 4.2      | Phase diagrams —                                                                                                               | 106        |
| 4.2.1    | Equilibrium and stability —                                                                                                    | 106        |
| 4.2.2    | Construction of the phase diagram —                                                                                            | 112        |
| 4.2.3    | Mechanisms of phase transitions —                                                                                              | 118        |
| 4.2.3.1  | Spinodal decomposition —                                                                                                       | 118        |
| 4.2.3.2  | Nucleation and growth —                                                                                                        | 119        |
| 4.3      | Osmotic pressure —                                                                                                             | 121        |
| 4.3.1    | Connection of the second virial coefficient, $A_2$ , to the Flory–Huggins parameter, $\chi$ , and the excluded volume, $v_e$ — | 125        |
| <b>5</b> | <b>Mechanics and rheology of polymer systems —</b>                                                                             | <b>129</b> |
| 5.1      | Fundamentals of rheology —                                                                                                     | 129        |
| 5.1.1    | Elementary cases of mechanical response —                                                                                      | 129        |

|          |                                                     |            |
|----------|-----------------------------------------------------|------------|
| 5.1.2    | Different types of deformation in rheology —        | 131        |
| 5.1.3    | The tensor form of Hooke's law —                    | 133        |
| 5.2      | Viscoelasticity —                                   | 135        |
| 5.2.1    | Elementary types of rheological experiments —       | 136        |
| 5.2.1.1  | The relaxation experiment —                         | 136        |
| 5.2.1.2  | The creep test —                                    | 136        |
| 5.2.1.3  | The dynamic experiment —                            | 137        |
| 5.3      | Complex moduli —                                    | 138        |
| 5.4      | Viscous flow —                                      | 141        |
| 5.5      | Methodology in rheology —                           | 145        |
| 5.5.1    | Oscillatory shear rheology —                        | 145        |
| 5.5.2    | Microrheology —                                     | 146        |
| 5.5.2.1  | Active microrheology —                              | 146        |
| 5.5.2.2  | Passive microrheology —                             | 147        |
| 5.6      | Principles of viscoelasticity —                     | 149        |
| 5.6.1    | Viscoelastic fluids: the Maxwell model —            | 149        |
| 5.6.2    | Viscoelastic solids: the Kelvin-Voigt model —       | 156        |
| 5.6.3    | More complex approaches —                           | 157        |
| 5.7      | Superposition principles —                          | 159        |
| 5.7.1    | The Boltzmann superposition principle —             | 160        |
| 5.7.2    | The thermal activation of relaxation processes —    | 162        |
| 5.7.3    | Time-temperature superposition —                    | 163        |
| 5.8      | Viscoelastic states of a polymer system —           | 167        |
| 5.8.1    | Qualitative discussion of the mechanical spectra —  | 167        |
| 5.8.2    | Quantitative discussion of the mechanical spectra — | 169        |
| 5.9      | Rubber elasticity —                                 | 172        |
| 5.9.1    | Chemical thermodynamics of rubber elasticity —      | 173        |
| 5.9.2    | Statistical thermodynamics of rubber elasticity —   | 174        |
| 5.9.3    | Swelling of rubber networks —                       | 182        |
| 5.10     | Terminal flow and reptation —                       | 185        |
| 5.10.1   | The tube concept —                                  | 186        |
| 5.10.2   | Rouse relaxation and reptation —                    | 187        |
| 5.10.3   | Reptation and diffusion —                           | 190        |
| 5.10.4   | Constraint release —                                | 192        |
| <b>6</b> | <b>Scattering analysis of polymer systems —</b>     | <b>193</b> |
| 6.1      | Basics of scattering —                              | 193        |
| 6.2      | Scattering regimes —                                | 196        |
| 6.3      | Structure and form factor —                         | 197        |
| 6.4      | Light scattering —                                  | 202        |

**X — Contents**

|       |                            |     |
|-------|----------------------------|-----|
| 6.4.1 | Static light scattering —  | 202 |
| 6.4.2 | Dynamic light scattering — | 210 |
| 7     | Closing remarks —          | 213 |
|       | Index —                    | 215 |
