Foreword

Space is one of the fundamental categories by means of which we perceive and experience the world around us. Behaviour takes place in space, and the geographical context of behaviour is important in shaping that behaviour. While space by itself explains very little, spatial processes and the spatial patterning of behaviour have long been viewed as a key to understanding, explaining, and predicting much of human behaviour.

Whether or not spatial analysis is a separate academic field, the fact remains that, in the past 20 years, spatial analysis has become an important by-product of the interest in and the need to understand georeferenced data. The current interest in the mainstream social sciences to geography in general, and location and spatial interaction in particular is a relatively recent phenomenon. This interest has generated an increasing demand for methods, techniques, and tools that allow an explicit treatment of space in empirical applications. Thus, spatial analysis tends to play an increasingly important role in measurement, hypothesis generation, and validation of theoretical constructs, activities that are crucial in the development of new knowledge. The fact that the 2008 Nobel Prize in economics was awarded to Paul Krugman indicates this increasing attention being given to spatially related phenomena and processes. Given the growing number of academics currently doing research on spatially related subjects, and the large number of questions being asked about spatial processes, the time has come for reflecting on the progress made in spatial analysis.

As an editor of the book series, I highly welcome the present edited volume on *Progress in Spatial Analysis* with a focus on theory and methods, and thematic applications across several academic disciplines. The effort is a worthy intellectual descendent of previous volumes in the series, including Anselin and Florax's *New Direction in Spatial Econometrics* in 1995, Fischer and Getis' *Recent Developments in Spatial Analysis* in 1997, and Anselin, Florax, and Rey's *Advances in Spatial Econometrics* in 2004.

I am pleased to realize the mixture of very well-established leaders in the field of spatial analysis and a new generation of scholars who, one hopes, will continue to carry the torch ignited more than 50 years ago at the dawn of *Quantitative Geography and Regional Science*. In this spirit, it is my hour to formally proffer the welcome to this edited volume, and to the effort poured into bringing major

developments and applications into a single source representing recent publications in spatial analysis. I anticipate that this volume will become a valuable reference, as the previous offerings in the series.

Contents

Progress in Spatial Analysis: Introduction	1
Antonio Páez, Julie Le Gallo, Ron N. Buliung, and Sandy Dall’Erba	
Part I Theory and Methods	
Omitted Variable Biases of OLS and Spatial Lag Models	17
R. Kelley Pace and James P. LeSage	
Topology, Dependency Tests and Estimation Bias in Network Autoregressive Models	29
Steven Farber, Antonio Páez, and Erik Volz	
Endogeneity in a Spatial Context: Properties of Estimators	59
Bernard Fingleton and Julie Le Gallo	
Dealing with Spatiotemporal Heterogeneity: The Generalized BME Model	75
Hwa-Lung Yu, George Christakos, and Patrick Bogaert	
Local Estimation of Spatial Autocorrelation Processes	93
Fernando López, Jesús Mur, and Ana Angulo	
Part II Spatial Analysis of Land Use and Transportation Systems	
“Seeing Is Believing”: Exploring Opportunities for the Visualization of Activity–Travel and Land Use Processes in Space–Time	119
Ron N. Buliung and Catherine Morency	
Pattern-Based Evaluation of Peri-Urban Development in Delaware County, Ohio, USA: Roads, Zoning and Spatial Externalities	149
Darla K. Munroe	

Demand for Open Space and Urban Sprawl: The Case of Knox County, Tennessee	171
Seong-Hoon Cho, Dayton M. Lambert, Roland K. Roberts, and Seung Gyu Kim	
Multilevel Models of Commute Times for Men and Women	195
Edmund J. Zolnik	
Walkability as a Summary Measure in a Spatially Autoregressive Mode Choice Model: An Instrumental Variable Approach	217
Frank Goetzke and Patrick M. Andrade	
Part III Economic and Political Geography	
Employment Density in Ile-de-France: Evidence from Local Regressions	233
Rachel Guillain and Julie Le Gallo	
The Geographic Dimensions of Electoral Polarization in the 2004 U.S. Presidential Vote	253
Ian Sue Wing and Joan L. Walker	
Gender Wage Differentials and the Spatial Concentration of High-Technology Industries	287
Elsie Echeverri-Carroll and Sofía G. Ayala	
Fiscal Policy and Interest Rates: The Role of Financial and Economic Integration	311
Peter Claeys, Rosina Moreno, and Jordi Suriñach	
Part IV Spatial Analysis of Population and Health Issues	
Spatial Models of Health Outcomes and Health Behaviors: The Role of Health Care Accessibility and Availability	339
Brigitte S. Waldorf and Susan E. Chen	
Immigrant Women, Preventive Health and Place in Canadian CMAs	363
Kelly Woltman and K. Bruce Newbold	
Is Growth in the Health Sector Correlated with Later-Life Migration?	381
Dayton M. Lambert, Michael D. Wilcox, Christopher D. Clark, Brian Murphy, and William M. Park	

Part V Regional Applications

Evolution of the Influence of Geography on the Location of Production in Spain (1930–2005)	407
Coro Chasco Yrigoyen and Ana M. López García	
Comparative Spatial Dynamics of Regional Systems	441
Sergio J. Rey and Xinyue Ye	
Growth and Spatial Dependence in Europe	465
Wilfried Koch	
Author Index	483
Subject Index	489

List of Figures

Topology, Dependency Tests and Estimation Bias in Network Autoregressive Models

Steven Farber, Antonio Páez, and Erik Volz

Figure 1	LR test rejection frequency for difference levels of spatial dependence	40
Figure 2	The impact of sample size on rejection frequency	41
Figure 3	Rejection frequency curves for two different sample sizes	41
Figure 4	The impact of mean degree on small networks	42
Figure 5	The impact of mean degree on large networks	42
Figure 6	The impact of clustering on rejection frequency	43
Figure 7	The impact of matrix density on rejection frequency	44
Figure 8	Dependence parameter estimation bias for different levels of dependence	46
Figure 9	The impact of sample size on dependence parameter estimation bias	46
Figure 10	The impact of mean degree on dependence parameter estimation bias	47
Figure 11	The effect of clustering on dependence parameter estimation bias	48
Figure 12	The relationship between matrix density and estimation bias	49
Figure 13	Goodness of fit scatterplots	53

Endogeneity in a Spatial Context: Properties of Estimators

Bernard Fingleton and Julie Le Gallo

Figure 1	Exogenous variable spatial distribution (a) and augmented spatial Durbin parameter distribution (b, c and d) resulting from Monte-Carlo simulations	65
Figure 2	Monte-Carlo distributions of the X parameter in (17) estimated by fitting (18) and (11)	66

Dealing with Spatiotemporal Heterogeneity: The Generalized BME Model

Hwa-Lung Yu, George Christakos, and Patrick Bogaert

Figure 1	Simulated random field realizations (<i>top row</i>); estimated field using GBME (<i>middle row</i>); and estimated field using GK (<i>bottom row</i>) at times $t = 0$ (<i>left column</i>), $t = 1$ (<i>middle column</i>), and $t = 2$ (<i>right column</i>)	82
Figure 2	Hard data (black circles), soft data in the form of uniform distributions (white circles), across space-time	82
Figure 3	Space-time distributions of the value of spatial order ν . (<i>Left</i>) $t = 0$, (<i>Middle</i>) $t = 1$, and (<i>Right</i>) $t = 2$	83
Figure 4	Space-time distributions of the value of temporal order μ . (<i>Left</i>) $t = 0$, (<i>Middle</i>) $t = 1$, and (<i>Right</i>) $t = 2$	83
Figure 5	Histograms of the estimation errors of the GBME (continuous line) and GK (dashed line) methods	84
Figure 6	Hard data (black circles) and uniform distributed data (white circles) across space-time	85
Figure 7	Histograms of the estimation errors of the GBME (continuous line) and GK (dashed line) methods	86
Figure 8	Hard data (black circles), and Gaussian-distributed data (white circles) across space-time	87
Figure 9	Histograms of the estimation errors of the GBME (continuous line) and GK (dashed line) methods	87

Local Estimation of Spatial Autocorrelation Processes

Fernando López, Jesús Mur, and Ana Angulo

Figure 1	Spatial regimes used in the experiment	100
Figure 2	Spatial distribution of ρ_r . Lattice $7 \times 7^{(*)}$	106
Figure 3	Spatial distribution of ρ_r . Lattice 20×20	107
Figure 4	Spatial distribution of ρ_r under the break. East–West structure	110
Figure 5	Spatial distribution of ρ_r under the break. Center–Periphery structure	111
Figure 6	The <i>doughnut effect</i> and the <i>Zoom</i> estimation	112

“Seeing Is Believing”: Exploring Opportunities for the Visualization of Activity–Travel and Land Use Processes in Space–Time

Ron N. Buliung and Catherine Morency

Figure 1	Critical dimensions and interactions between activity-travel and land-use systems	124
Figure 2	The Greater Toronto Area (GTA) and Greater Montreal Area (GMA)	125
Figure 3	Chronology of the spatial location of the mobile population during an average weekday in the GMA (1998)	127

Figure 4	Chronology of the spatial location of the mobile population during a typical weekday in the GTA & Hamilton (2001)	128
Figure 5	GTA trip density excluding high density CBD traffic zones (2001 TTS)	129
Figure 6	People accumulation profile in the Central Business District (GMA) segmented by region of home location (1998)	130
Figure 7	2003 Car accumulation profile (CAP), four districts (x: time of day, y: number of cars)	132
Figure 8	Monitoring of the number of cars parked in a specific area during a typical weekday	133
Figure 9	Demographic structure with segmentation related to transit use (1987 & 1998 OD surveys), central Montreal	133
Figure 10	Geopolitical and network based conceptualizations of urban areas	135
Figure 11	Network Occupancy Index (top) and Transit Network Occupancy Index (bottom) estimated for 100 traffic analysis zones	137
Figure 12	Weighted Gaussian bivariate kernel estimation	140
Figure 13	Geovisualization of power retail capacity in the Greater Toronto Area (1997–2005)	142
Figure 14	Centrographic estimation and geovisualization of power centre expansion	143

Pattern-Based Evaluation of Peri-Urban Development in Delaware County, Ohio, USA: Roads, Zoning and Spatial Externalities

Darla K. Munroe

Figure 1	Study area	150
Figure 2	Graphical illustration of variations in edge-to-area ratio and the corresponding landscape shape index (LSI). (a) A square patch made up of nine individual squares of dimension 2×2 . (b) A non-square patch made up of the same nine individual squares, arranged less squarely. (c) A non-square patch made up of nine individual squares, arranged nearly linearly	156
Figure 3	Landscape pattern analysis of Delaware County, 1988–2003. (a) Percent developed area (of total land) and Euclidean nearest neighbor distance edge-to-edge between contiguous parcels (km). (b) The number of patches (contiguous parcels sharing a common boundary) and the landscape shape index (higher = greater proportional edge in the landscape)	160

Demand for Open Space and Urban Sprawl: The Case of Knox County, Tennessee

Seong-Hoon Cho, Dayton M. Lambert, Roland K. Roberts, and Seung Gyu Kim

Figure 1	Study area	180
Figure 2	Transaction parcel with surrounding open space and 1.0-mile buffer	181

Figure 3	Marginal implicit price of open space (10,000 square foot increase in open space)	185
Figure 4	Price elasticity of open-space demand	186
Figure 5	Income elasticity of open-space demand	186
Figure 6	Lot size elasticity of open-space demand	187
Figure 7	Finished-area elasticity of open-space demand	187
Figure 8	Housing-density elasticity of open-space demand	188

Multilevel Models of Commute Times for Men and Women

Edmund J. Zolnik

Figure 1	Population size of MSAs ($n = 43$) by region	200
Figure 2	Regional differences in commute times from men-only, women-only, and pooled men–women multilevel models	211

Walkability as a Summary Measure in a Spatially Autoregressive Mode Choice Model: An Instrumental Variable Approach

Frank Goetzke and Patrick M. Andrade

Figure 1	Map with the household locations of all the included trips	222
-----------------	--	-----

Employment Density in Ile-de-France: Evidence from Local Regressions

Rachel Guillain and Julie Le Gallo

Figure 1	Departments and communes in Ile-de-France. Scale: 1:9,000	236
Figure 2	CBD, new towns and highways. Scale: 1:9,000	237
Figure 3	Geographic distribution of the density gradient for total employment. Scale 1:9,000	244
Figure 4	Geographic distribution of the density gradient for industrial employment. Scale 1:9,000	245
Figure 5	Geographic distribution of the density gradient for high-order services employment. Scale 1:9,000	245
Figure 6	Geographic distribution of the density gradient for high-tech employment. Scale 1:9,000	246
Figure 7	Geographic distribution of the density gradient for standard services employment. Scale 1:9,000	246
Figure 8	Geographic distribution of the density gradient for finance-insurance employment. Scale 1:9,000	247
Figure 9	Geographic distribution of the density gradient for consumer services employment. Scale 1:9,000	247

The Geographic Dimensions of Electoral Polarization in the 2004 U.S. Presidential Vote

Ian Sue Wing and Joan L. Walker

Figure 1	Electoral polarization: a conceptual framework	255
Figure 2	Box plot of descriptive statistics of the dataset	258

Figure 3	Local Moran's I significance maps of votes and key covariates . . .	268
Figure 4	Log-odds of voting republican by county clusters	270
Figure 5	Geographically weighted regression results	276
Figure 6	Local Moran's I significance maps of GWR odds elasticities	278
Figure 7	GWR odds elasticities of voting republican by county lusters . . .	279
Figure 8	GWR odds elasticities: global and local correlations	281

Fiscal Policy and Interest Rates: The Role of Financial and Economic Integration

Peter Claeys, Rosina Moreno, and Jordi Suriñach

Figure 1	Baseline model, spatial model estimates (W = distance matrix) . .	326
-----------------	--	-----

Spatial Models of Health Outcomes and Health Behaviors: The Role of Health Care Accessibility and Availability

Brigitte S. Waldorf and Susan E. Chen

Figure 1	Spatial linkages of a health production function (HPF)	344
Figure 2	Cumulative distribution of physicians relative to the cumulative population distribution across Indiana counties, 2003	347
Figure 3	Spatial distribution of elderly CVD mortality (<i>left</i>) and elderly cancer mortality (<i>right</i>)	353
Figure 4	Spatial distribution of maternal smoking rates (<i>left</i>) and rates of prenatal care (<i>right</i>)	353
Figure 5	Spatial distribution of nurses per person (<i>left</i>) and access to hospital care (<i>right</i>)	354

Is Growth in the Health Sector Correlated with Later-Life Migration?

Dayton M. Lambert, Michael D. Wilcox, Christopher D. Clark, Brian Murphy, and William M. Park

Figure 1	Distribution of quantile proportions of total in-migrants composed of individuals in the 55–69 (top panel) and 70+ age cohorts (bottom panel)	388
Figure 2	Semivariograms of residual error structure	395
Figure 3	Top panel, unshaded counties are those with rurality indices ≤ 0.52 ; bottom panel, counties with rurality indices ≥ 0.49 . Both are associated with positive change in the professional concentration of MD's and the office-based MD sub-group	397
Figure 4	Marginal effects of selected demographic and socio-economic variables on changes in location quotients measuring different medical professions across a rural–urban continuum	398
