Design of a Portfolio Management System for Software Line Development

Merging the Gap between Software Project and Product Management in Global EADS Programs

GRIN - Your knowledge has value

Since its foundation in 1998, GRIN has specialized in publishing academic texts by students, college teachers and other academics as e-book and printed book. The website www.grin.com is an ideal platform for presenting term papers, final papers, scientific essays, dissertations and specialist books.

Design of a Portfolio Management System for Software Line Development

Merging the Gap between Software Project and Product Management in Global EADS Programs

Master's Thesis

in the Programme Business Informatics

at the AKAD Privat-Hochschulen

created by Michael Lang

Thesis submitted in partial fulfilment of the requirements of AKAD Hochschule Stuttgart for the degree of Master of Science

Ulm, January 2013

Acknowledgement

First and foremost, I would like to express my deepest sense of gratitude to my advisor, Prof. Dr. Josef L. Staud, who has supported me throughout my thesis with his patience and knowledge whilst allowing me the room to work in my own way. Besides, I also acknowledge my gratitude to the EADS Germany GmbH for the practical application of this thesis. I am especially thankful for the cooperation with the program management of the EADS defence and security division Cassidian. They supported me during my master's thesis with practical advice and enabled the execution of the expert interviews with the corresponding stakeholder groups. My sincere thanks also go to Nicolas Lefeuvre, Thomas Köhler, Markus Müh and Achim Eckl for their participation in the survey and for establishing contacts to the respective departments within Cassidian.

Last but not the least, I would like to thank my father, Franz-Josef Lang, Marcel Gebhard and Johannes Ferstl for the review of my thesis and their helpful remarks. Finally, I thank everyone, who has supported me during the writing of this scientific work.

Abstract

Tracy (1995, p. 19) emphasises in his book that in the twenty-first century, tomorrow will be more different from today than in the past. Therefore today's corporations get to stay innovative, reinvent themselves continuously and have to design new business. In contrast to that, software mastery becomes more than ever the key factor for business success (Northrop, 2008, p. 12). In the twenty-first century, software pervades every sector and has become the bottom line for many organisations.

Therefore, reusability plays a growing role for every business in today's rapid changing world (Strahringer, 2003, p. 5). Thus, new paradigms in software engineering are focusing on the reutilisation and modularisation of software solutions. One innovative and growing concept since 2003 is software line development which has its origin in the automotive and fashion industry (Strahringer, 2003, p. 5). The key benefits of software line development is the covering of a wide field of application with minimal extra costs by reuse of a common software platform. In reference to Ebert & Smouts (2003, p. 29) the most publications in the field of software line development into enterprises' product portfolios has been till now widely neglected. In contrast to that Jeffery & Leliveld (2004) points out that the failure or success of software lines highly depend in particular on their level of integration into companies' product portfolio system.

For this reason, the major goal of this research is the realisation of an integrated portfolio management system for software line development. This covers at first the determination of the role portfolio management in organisational governance. Thereafter the general elements of a portfolio management system will be identified. On the other side, the specific demands of software line engineering according to the portfolio elements will be analysed. The insights of the analysis build the basis for the design of the software product line portfolio management system. The design describes the portfolio management system from different architectural perspectives which represent the viewpoint of the diverse stakeholders. Moreover, different analysis methods will be evaluated with a respective scoring model for the software line product, domain and asset application domain. The realised software line portfolio management system will be applied for a Cassidian product for a first validation of the model in practice. Finally, the achieved results as well as the own approach will be reflected. At the end, the scientific work gives a suggestion for further investigations in the scope of software line portfolio management.

Contents
